The tank truck load-out system is designed so that drivers can safely
leave the comfort of your office chair to view the features of this
technology and the recent advances in the industry.

C.W. Matthews has had a long business relationship with the
National Asphalt Pavement Association. It was deemed necessary to
increase the plant’s capacity for the future. Matthews and his
companies are involved in many projects to increase the
capacity. The company plans to continue to expand its facilities.

Matthews says that the C.W. Matthews plants produced more than 5.5
million tons of AC in the course of a normal year. In 2008, for example, the
company produced 7.1 million tons of AC. The large increases in
production have led Matthews to install several large asphalt storage tanks
on its property. The new Rockmart Terminal includes the following:

- Two hot-oil heaters and a steam generator;
- Fuel storage tanks for diesel and waste oil;
- A complete polymer-blending system with tanks for
  blending it with other materials to alter its properties for
  different applications;
- Six asphalt storage tanks with a capacity of 54,000 barrels;
- Two asphalt storage tanks with a capacity of 26,000 barrels;
- A tank-car unloading system that can unload 20 cars
  simultaneously;
- An office and a laboratory.

Matthews says that his company will continue to expand its facilities,
and that it is already planning for additional storage tanks and
processing equipment. Matthews says that his company is looking
at state-of-the-art technology, and that it is working with different
industries to find ways to improve its processes. His company is
also looking at ways to reduce its environmental impact, and is
planning to install new equipment to reduce emissions from its
facilities.
